|-----|------------|--|-----------------------|
| 0-L | IMMUNIZ    | The act of immunization of a patient using a particular substance or class of substances identified using a specified vocabulary. Use of this vocabulary term requires the use of either the SUBSTANCE or SUBSTCLASS qualifier described below, along with an identified substance or class of substances.   | IHEActCode Vocabulary |
| 0-L | INTOL      | An observation that a patient is somehow intollerant of (e.g., allergic to) a particular substance or class of substances using a specified vocabulary. Use of this vocabulary term requires the use of either the SUBSTANCE or SUBSTCLASS qualifi   | IHEActCode Vocabulary |
| 0-L | PINSTRUCT  | This is the act of providing instructions to a patient regarding the use of medication.  | IHEActCode Vocabulary |
| 0-L | SUBSTANCE  | A qualifier that identifies the substance used to treat a patient in an immunization or drug treatment act. The substance is expected to be identified using a vocabulary such as RxNORM, SNOMED CT or other similar vocabulary and should be specific enough to identify the ingredients of the substance used.   | IHEActCode Vocabulary |
| 0-L | SUBSTCLASS | A qualifier that identifies the class of substance used to treat a patient in an immunization or drug treatment act. The class of substances is expected to be identified using a vocabulary such as NDF-RT, SNOMED CT or other similar vocabulary, and should be broad enough to classify substances by mechanism of action (e.g., Beta Blocker), intended effect (Diuretic, antibiotic) or ... | IHEActCode Vocabulary |

| 0-L                | 10160-0 | History of medication use   | Logical Observation Identifier Names and Codes | The medications section shall contain a description of the relevant medications for the patient, e.g. an ambulatory prescription list. It shall include entries for medications as described in the Entry Content Module. All prescribed medicine whose period of time indicated for the treatment has not yet expired whether it has been dispensed or not. |               |
| 0-L                | 10162-6 | History of pregnancies  | Logical Observation Identifier Names and Codes |  |               |
| 0-L                | 10164-2 | History of present illness  | Logical Observation Identifier Names and Codes | The history of present illness section shall contain a description of the sequence of events preceding the patient's current complaints. Step by step description of etiopathogenesis of current problem patient is being treated for.   |               |
| 0-L                | 11348-0 | History of past illness   | Logical Observation Identifier Names and Codes | The History of Past Illness section shall contain a description of the conditions the patient suffered in the past. It shall include entries for problems as described in the Entry Content Modules. Illness which set on and resolved in the past.  |               |
| 0-L                | 11369-6 | History of immunization   | Logical Observation Identifier Names and Codes | The immunizations section shall contain a description of the immunizations administered to the patient in the past. It shall include entries for medication administration as described in the Entry Content Modules. Active immunizations received in the past.   |               |
| 0-L                | 11450-4 | Problem list  | Logical Observation Identifier Names and Codes | The active problem section shall contain a description of the conditions currently being monitored for the patient. It shall include entries for patient conditions as described in the Entry Content Module. Chronic, recurring or persistent illnesses, requiring repeated reassessment and/or continuous/periodic therapy.                                |               |
| 0-L                | 18776-5 | Plan of treatment   | Logical Observation Identifier Names and Codes | The care plan section shall contain a description of the expectations for care including proposals, goals, and order requests for monitoring, tracking, or improving the condition of the patient. Therapeutic recommendations that do not include drugs   |               |
| 0-L                | 29554-3 | Procedures  | Logical Observation Identifier Names and Codes | The procedure entry is used to record procedures that have occurred, or which are planned for in the future.   |               |
| 0-L                | 29762-2 | Social history  | Logical Observation Identifier Names and Codes |  |               |
| 0-L                | 30954-2 | Relevant diagnostic tests/  | Logical Observation Identifier Names and Codes |  |               |

|     |         |                                      |  |  |
|-----|---------|--------------------------------------|--|--|
|     |         | laboratory data                      |  |  |
| 0-L | 46264-8 | History of medical device use        | Logical Observation Identifier Names and Codes | The medical devices section contains text describing the patient history of medical device use. Documented necessity to use a device replacing/supporting completely/partially a body organ/organ system function.   |
| 0-L | 47420-5 | Functional status assessment         | Logical Observation Identifier Names and Codes | The Coded Functional Status Assessment Section provided a machine readable and description of the patient's status of normal functioning at the time the document was created. Pain Scale Assessment, Braden Score Assessment, and Geriatric Depression Scale are subsections of the Functional Status Assessment Section  |
| 0-L | 47519-4 | History of Procedures                | Logical Observation Identifier Names and Codes | The list of surgeries section shall include entries for procedures and references to procedure reports when known as described in the Entry Content Modules. Surgical or other invasive procedures in the past, on vital organs/body cavities/vascular or central nervous system.  |
| 0-L | 48765-2 | Allergies, adverse reactions, alerts | Logical Observation Identifier Names and Codes | The adverse and other adverse reactions section shall contain a description of the substance intolerances and the associated adverse reactions suffered by the patient. It shall include entries for intolerances and adverse reactions as described in the Entry Content Modules Presence/absence of potentially life threatening reaction to substances/factors, to which patient can be exposed in the environment, or during treatment, of allergic or other known nature. |
| 0-L | 57828-6 | Prescriptions                        | Logical Observation Identifier Names and Codes |  |

**Description**

**History description 2014-03-26:** Lock all vaue sets untouched since 2014-03-26 to trackingId 2014T1\_2014\_03\_26

**description:**

The set of Act class codes allowed for the ACT class clone in the CDA Clinical Statement model. The scope of this value set are those Act class codes not otherwise covered by specific classes in the CDA Clinical Statement model and required to enable representation of Clinical Statement in CDA.

**Source Code System**

< DESCRIPTION TO BE UPDATED >

Note for the readers

*This template version represents the best representation of the original epSOS/EXPAND specifications in ART DECOR. However the original epSOS/EXPAND specifications in Microsoft Word took the original IHE Templates and added constraints in written language. This actually is not best practice in electronic Template Design because the additional constraints are not assigned to the original IHE template but rather than that are text only constraints. In order to make everything computable new Template OIDs need to be assigned to the epSOS Templates in order to cover both, the original IHE Template Design and the additional constraints from epSOS in the text and represent them electronically.*

*Caveat: for the above mentioned reasons this version cannot be used for (automatic) testing/validation purposes. It shall be used however as basis for refinement (repository)*

*Note: there is a new version planned that covers all above and makes proper testing/validation possible*

**epSOS ePrescription Template**

The implementers must be familiar with the context of the project, as it shall not be repeated in this document. The implementers must also be familiar with the content of the following documents:

- CDA Release 2.0 Normative Web Edition, May, 2005
- HL7 Implementation Guide: CDA Release 2 – Continuity of Care Document (CCD), HL7, April 1, 2007.
- Integrating the Healthcare Enterprise, Patient Care Coordination Technical Framework, Volume 1 and Volume 2- Revision 10, IHE International, November 4, 2014.
- Integrating the Healthcare Enterprise, Patient Care Coordination CDA Content Modules- Trial Implementation Supplement, December 3, 2014.
- HL7 Implementation Guide for CDA Release 2: History and Physical (H&P) Notes, HL7, July 16, 2008.
- .

It must also be noted that although the guidelines are based on the above documents, they contain specific developments particular to the project epSOS. This document can be used as a standalone to develop the syntax of the epSOS documents; however in order to achieve the full functionality of the epSOS Semantic Services, they are to be used within the context of the deliverable 3.9.1.

< DESCRIPTION TO BE UPDATED >

Note for the readers

*This template version represents the best representation of the original epSOS/EXPAND specifications in ART DECOR. However the original epSOS/EXPAND specifications in Microsoft Word took the original IHE Templates and added constraints in written language. This actually is not best practice in electronic Template Design because the additional constraints are not assigned to the original IHE template but rather than that are text only constraints. In order to make everything computable new Template OIDs need to be assigned to the epSOS Templates in order to cover both, the original IHE Template Design and the additional constraints from epSOS in the text and represent them electronically.*

*Caveat: for the above mentioned reasons this version cannot be used for (automatic) testing/validation purposes. It shall be used however as basis for refinement (repository)*

*Note: there is a new version planned that covers all above and makes proper testing/validation possible*

epSOS Patient Summary Template

The implementers must be familiar with the context of the project, as it shall not be repeated in this document. The implementers must also be familiar with the content of the following documents:

- CDA Release 2.0 Normative Web Edition, May, 2005
- HL7 Implementation Guide: CDA Release 2 – Continuity of Care Document (CCD), HL7, April 1, 2007.
- Integrating the Healthcare Enterprise, Patient Care Coordination Technical Framework, Volume 1 and Volume 2- Revision 10, IHE International, November 4, 2014.
- Integrating the Healthcare Enterprise, Patient Care Coordination CDA Content Modules- Trial Implementation Supplement, December 3, 2014.
- HL7 Implementation Guide for CDA Release 2: History and Physical (H&P) Notes, HL7, July 16, 2008.

It must also be noted that although the guidelines are based on the above documents, they contain specific developments particular to the project epSOS. This document can be used as a standalone to develop the syntax of the epSOS documents; however in order to achieve the full functionality of the epSOS Semantic Services, they are to be used within the context of the deliverable 3.9.1.

Prescribed and dispensed medications, including a specification of the Medication Summary section used in the Patient Summary document, have described in the previous chapter. The following sub-paragraphs specify how other sections that may be present in a Patient Summary are implemented.

According to requirements described in the Body Data Elements, the following sections - at least - shall be present in a Patient Summary document:

The Medication Summary Section 1.3.6.1.4.1.12559.11.10.1.3.1.2.3

The Allergies and Other Adverse Reactions Section 1.3.6.1.4.1.19376.1.5.3.1.3.13

The Coded List of Surgeries Section 1.3.6.1.4.1.19376.1.5.3.1.3.12

The Active Problems Section 1.3.6.1.4.1.19376.1.5.3.1.3.6

The Medical Devices Coded Section 1.3.6.1.4.1.12559.11.10.1.3.1.2.4

Appropriated codes and/or nullFlavor values will be used in these sections to express for example that coded information is not available, either that an entry is not applicable or that information is not known, .... See the related paragraph for further details.

Description

### **Note for the readers**

***This template version represents the best representation of the original epSOS/EXPAND specifications in ART DECOR. However the original epSOS/EXPAND specifications in Microsoft Word took the original IHE Templates and added constraints in written language. This actually is not best practice in electronic Template Design because the additional constraints are not assigned to the original IHE template but rather than that are text only constraints. In order to make everything computable new Template OIDs need to be assigned to the epSOS Templates in order to cover both, the original IHE Template Design and the additional constraints from epSOS in the text and represent them electronically.***

***Caveat: for the above mentioned reasons this version cannot be used for (automatic) testing/validation purposes. It shall be used however as basis for refinement (repository)***

***Note: there is a new version planned that covers all above and makes proper testing/validation possible***

### epSOS ePrescription Template

The implementers must be familiar with the context of the project, as it shall not be repeated in this document. The implementers must also be familiar with the content of the following documents:

- CDA Release 2.0 Normative Web Edition, May, 2005
- HL7 Implementation Guide: CDA Release 2 – Continuity of Care Document (CCD), HL7, April 1, 2007.
- Integrating the Healthcare Enterprise, Patient Care Coordination Technical Framework, Volume 1 and Volume 2- Revision 10, IHE International, November 4, 2014.
- Integrating the Healthcare Enterprise, Patient Care Coordination CDA Content Modules- Trial Implementation Supplement, December 3, 2014.
- HL7 Implementation Guide for CDA Release 2: History and Physical (H&P) Notes, HL7, July 16, 2008.
- .

It must also be noted that although the guidelines are based on the above documents, they contain specific developments particular to the project epSOS. This document can be used as a standalone to develop the syntax of the epSOS documents; however in order to achieve the full functionality of the epSOS Semantic Services, they are to be used within the context of the deliverable 3.9.1.

Description

**Note for the readers**

***This template version represents the best representation of the original epSOS/EXPAND specifications in ART DECOR. However the original epSOS/EXPAND specifications in Microsoft Word took the original IHE Templates and added constraints in written language. This actually is not best practice in electronic Template Design because the additional constraints are not assigned to the original IHE template but rather than that are text only constraints. In order to make everything computable new Template OIDs need to be assigned to the epSOS Templates in order to cover both, the original IHE Template Design and the additional constraints from epSOS in the text and represent them electronically.***

***Caveat: for the above mentioned reasons this version cannot be used for (automatic) testing/validation purposes. It shall be used however as basis for refinement (repository)***

*Note: there is a new version planned that covers all above and makes proper testing/validation possible*

**epSOS eDispensation Template**

The implementers must be familiar with the context of the project, as it shall not be repeated in this document. The implementers must also be familiar with the content of the following documents:

- CDA Release 2.0 Normative Web Edition, May, 2005
- HL7 Implementation Guide: CDA Release 2 – Continuity of Care Document (CCD), HL7, April 1, 2007.
- Integrating the Healthcare Enterprise, Patient Care Coordination Technical Framework, Volume 1 and Volume 2- Revision 10, IHE International, November 4, 2014.
- Integrating the Healthcare Enterprise, Patient Care Coordination CDA Content Modules- Trial Implementation Supplement, December 3, 2014.
- HL7 Implementation Guide for CDA Release 2: History and Physical (H&P) Notes, HL7, July 16, 2008.

It must also be noted that although the guidelines are based on the above documents, they contain specific developments particular to the project epSOS. This document can be used as a standalone to develop the syntax of the epSOS documents; however in order to achieve the full functionality of the epSOS Semantic Services, they are to be used within the context of the deliverable 3.9.1.

Description

**epSOS Health Care Encounter Report Template**

The implementers must be familiar with the context of the project, as it shall not be repeated in this document. The implementers must also be familiar with the content of the following documents:

- CDA Release 2.0 Normative Web Edition, May, 2005

- HL7 Implementation Guide: CDA Release 2 – Continuity of Care Document (CCD), HL7, April 1, 2007.
- Integrating the Healthcare Enterprise, Patient Care Coordination Technical Framework, Volume 1 and Volume 2- Revision 5, IHE International, August 10, 2009.
- Integrating the Healthcare Enterprise, Patient Care Coordination CDA Content Modules- Trial Implementation Supplement, August 10, 2009.
- HL7 Implementation Guide for CDA Release 2: History and Physical (H&P) Notes, HL7, July 16, 2008.

The Healthcare Encounter Report service not only supports the patient summary extension use case, but also supports the ePrescription extension use case and the 112 emergency use case. Therefore this service description only covers the patient summary extension, but also the ePrescription extension and the part of the 112 emergency use case where information about the emergency encounter is sent back to country A.

The definition of a healthcare event can be broad. The HCER service is designed to offer a health professional in country B flexibility to record a wide range of medical information, enough to cover the most basic health encounters. The service offers country A the basic contact information of the health professional in country B together with the medical information gathered during the healthcare encounter. Informing country A of a health encounter in county B, of course, is done with consent of the patient.

Description

**epSOS Medication Related Overview Template**

The implementers must be familiar with the context of the project, as it shall not be repeated in this document. The implementers must also be familiar with the content of the following documents:

- CDA Release 2.0 Normative Web Edition, May, 2005
- HL7 Implementation Guide: CDA Release 2 – Continuity of Care Document (CCD), HL7, April 1, 2007.
- Integrating the Healthcare Enterprise, Patient Care Coordination Technical Framework, Volume 1 and Volume 2- Revision 5, IHE International, August 10, 2009.
- Integrating the Healthcare Enterprise, Patient Care Coordination CDA Content Modules- Trial Implementation Supplement, August 10, 2009.
- HL7 Implementation Guide for CDA Release 2: History and Physical (H&P) Notes, HL7, July 16, 2008.

The Medication Related Overview (MRO) is a document for informational purposes only that supports all possible information that might be needed in the process of prescribing, dispensing (and possibly even administering) medication to the patient in a foreign country.

The absolute minimum set of medical information in the MRO consists of all the coded prescriptions and medication dispenses available in country A. Other useful information for the medication process, such as allergies and intolerances, are in the extended data set of the MRO.

**Note for the readers**

*This template version represents the best representation of the original epSOS/EXPAND specifications in ART DECOR. However the original epSOS/EXPAND specifications in Microsoft Word took the original IHE Templates and added constraints in written language. This actually is not best practice in electronic Template Design because the additional constraints are not assigned to the original IHE template but rather than that are text only constraints. In order to make everything computable new Template OIDs need to be assigned to the epSOS Templates in order to cover both, the original IHE Template Design and the additional constraints from epSOS in the text and represent them electronically.*

*Caveat: for the above mentioned reasons this version cannot be used for (automatic) testing/validation purposes. It shall be used however as basis for refinement (repository)*

*Note: there is a new version planned that covers all above and makes proper testing/validation possible*

**epSOS Patient Summary Template**

The implementers must be familiar with the context of the project, as it shall not be repeated in this document. The implementers must also be familiar with the content of the following documents:

- CDA Release 2.0 Normative Web Edition, May, 2005
- HL7 Implementation Guide: CDA Release 2 – Continuity of Care Document (CCD), HL7, April 1, 2007.
- Integrating the Healthcare Enterprise, Patient Care Coordination Technical Framework, Volume 1 and Volume 2- Revision 10, IHE International, November 4, 2014.
- Integrating the Healthcare Enterprise, Patient Care Coordination CDA Content Modules- Trial Implementation Supplement, December 3, 2014.
- HL7 Implementation Guide for CDA Release 2: History and Physical (H&P) Notes, HL7, July 16, 2008.

It must also be noted that although the guidelines are based on the above documents, they contain specific developments particular to the project epSOS. This document can be used as a standalone to develop the syntax of the epSOS documents; however in order to achieve the full functionality of the epSOS Semantic Services, they are to be used within the context of the deliverable 3.9.1.

Prescribed and dispensed medications, including a specification of the Medication Summary section used in the Patient Summary document, have described in the previous chapter. The following sub-paragraphs specify how other sections that may be present in a Patient Summary are implemented.

According to requirements described in the Body Data Elements, the following sections - at least - shall be present in a Patient Summary document:

The Medication Summary Section 1.3.6.1.4.1.12559.11.10.1.3.1.2.3

The Allergies and Other Adverse Reactions Section 1.3.6.1.4.1.19376.1.5.3.1.3.13

The Coded List of Surgeries Section 1.3.6.1.4.1.19376.1.5.3.1.3.12

The Active Problems Section 1.3.6.1.4.1.19376.1.5.3.1.3.6

The Medical Devices Coded Section 1.3.6.1.4.1.12559.11.10.1.3.1.2.4

Appropriated codes and/or nullFlavor values will be used in these sections to express for example that coded information is not available, either that an entry is not applicable or that information is not known, ..... See the related paragraph for further details.

**Description**

Allergies and intolerances are special kinds of problems, and so are also recorded in the CDA <observation> element, with classCode='OBS'. They follow the same pattern as the problem entry, with exceptions noted below.

Parent Template

This is a specialization of the IHE PCC Problem Entry 1.3.6.1.4.1.19376.1.5.3.1.4.5 and of the CCD alert observation template 2.16.840.1.113883.10.20.1.18

| <b>Description</b> |  |                       |  |

The adverse and other adverse reactions section shall contain a narrative description of the substance intolerances and the associated adverse reactions suffered by the patient. It shall include entries for intolerances and adverse reactions as described in the Entry Content Modules.

The parent of this template is CCD 3.8. This template is compatible with the ASTM/HL7 Continuity of Care Document template: 2.16.840.1.113883.10.20.1.2

The field "alerts" was originally defined to include all the important and objective medical information that should be highlighted (such as allergies, thrombosis risk, immune deficit ...etc). When defining the content only allergies and intolerance to drugs appear to be the common understanding and the easiest to be transferred. A lot of surveys are being made in different countries (not only in Europe) to make a more evidence-based definition of what should be represented and should not byt the concept "alerts", hence not enough information could be provided to take a further decision. As epSOS's intention is not to duplicate information, this shall not be repeated. Alerts are difiucult to represent since they are contextual. Alerts may be represented as severe or life-threatening allergies or other adverse reactions. Another area are certain selected procedures and implanted devices. The section Allergies and Other Adverse Reactions contains the medical alerts as well, based on the servery, and their representation becomes a Country B choice.

**Description**

This entry is a specialization of the Concern Entry, wherein the subject of the concern is focused on an allergy or intolerance.

This entry has a template identifier of 1.3.6.1.4.1.19376.1.5.3.1.4.5.3, and is a subtype of the Concern entry, and so must also conform to the rules of the Concern Entry. These elements are required and shall be recorded exactly as shown above.

This entry shall contain one or more allergy or intolerance entries that conform to the Allergy and Intolerance Entry Content Module. This shall be represented with the <entryRelationship> element. The typeCode shall be 'SUBJ' and inversionInd shall be 'false'

## Description

A CDA document shall have at least one author. Authors could be either human (ClinicalDocument/author/assignedAuthor/assignedPerson) either devices (ClinicalDocument/author/assignedAuthor/assignedAuthoringDevice).

For definition “The `author` element represents the creator of the clinical document. If the role of the actor is the **entry of information from his or her own knowledge or application of skills**, that actor is the author. If one actor provides information to another actor **who filters, reasons, or algorithmically creates new information**, then that second actor **is also an author, having created information from his or her own knowledge or skills.**” [From Implementation Guide for CDA Release 2: Imaging Integration – UV Realm, March 2009].

According to this definition, not any device that generates the electronic document has to be considered as an author:

- a spider collecting and filtering information from different repositories, according to defined rules and policies, for the scope of creating a Patient Summary is definitely a document author (and maybe the only one for this document);
- an application that transforms a prescription record into a eP CDA may not be an author instead;
- The NCP that modifies the concepts conveyed, should appear as one of the authors.
- The author of the parent document is often also an author of the document generated through a transformation process (in that case also the author time should be the same).

Further to this, is therefore possible to determine the Nature of Patient Summary as follows [Excluding the NCPs as authors]:

- if there is a person author only, there the Patient Summary is the result of a practitioner clinical act;
- if there is a device author only, the summary was automatically generated according to well defined rules defined by the responsible organization;
- if there are both a person and a device as authors, the summary was created via a mixed approach.

The CDA provides a mechanism to better specify who authored what within the document, allowing the specification of authorship at the whole document level, at the section level and finally at the entry level. In any case is not required to repeat this information for each level, taking advantage of the context conduction propriety. Infact “context that is specified on an outer tag holds true for all nested tags, unless overridden on a nested tag. Context specified on a tag within the CDA body always overrides context propagated from an outer tag. For instance, the specification of authorship at a document section level overrides all authorship propagated from outer tags.” (HL7 CDA R2 Standard).

---

/ClinicalDocument/author/assignedAuthor

/ClinicalDocument/documentationOf/serviceEvent/performer (this applies to the prescriber and the dispenser).

The template ID referenced here refers to HP information in the /ClinicalDocument/documentationOf/serviceEvent/performer structure. In this document, the same requirements apply to the person author of the document (if there is one), and to the prescriber and dispenser (see body).

When there is no HP but we have the method of assembly of data by a device, such as the “spider” method, we have the following expression; ClinicalDocument/author/assignedAuthor/assignedAuthoringDevice.

When the data is collected from different sources & pre-existing documents that are part of a bigger system. In that case the organization responsible of that collection “signed” the PS as responsible.

ClinicalDocument/author/assignedAuthor/representedOrganization

| <b>Description</b> |  |                       |  |

A CDA document shall have at least one author. Authors could be either human (ClinicalDocument/author/assignedAuthor/assignedPerson) either devices (ClinicalDocument/author/assignedAuthor/assignedAuthoringDevice).

For definition “The `author` element represents the creator of the clinical document. If the role of the actor is the **entry of information from his or her own knowledge or application of skills**, that actor is the author. If one actor provides information to another actor **who filters, reasons, or algorithmically creates new information**, then that second actor **is also an author, having created information from his or her own knowledge or skills.**” [From Implementation Guide for CDA Release 2: Imaging Integration – UV Realm, March 2009].

According to this definition, not any device that generates the electronic document has to be considered as an author:

- a spider collecting and filtering information from different repositories, according to defined rules and policies, for the scope of creating a Patient Summary is definitely a document author (and maybe the only one for this document);
- an application that transforms a prescription record into a epSOS eP CDA may not be an author instead;
- The NCP that modifies the concepts conveyed, should appear as one of the authors.
- The author of the parent document is often also an author of the document generated through a transformation process (in that case also the author time should be the same).

Further to this, is therefore possible to determine the Nature of Patient Summary as follows [Excluding the NCPs as authors]:

- if there is a person author only, there the Patient Summary is the result of a practitioner clinical act;
- if there is a device author only, the summary was automatically generated according to well defined rules defined by the responsible organization;
- if there are both a person and a device as authors, the summary was created via a mixed approach.

The CDA provides a mechanism to better specify who authored what within the document, allowing the specification of authorship at the whole document level, at the section level and finally at the entry level. In any case is not required to repeat this information for each level, taking advantage of the context conduction propriety. Infact “context that is specified on an outer tag holds true for all nested tags, unless overridden on a nested tag. Context specified on a tag within the CDA body always overrides context propagated from an outer tag. For instance, the specification of authorship at a document section level overrides all authorship propagated from outer tags.” (HL7 CDA R2 Standard).

/ClinicalDocument/author/assignedAuthor

/ClinicalDocument/documentationOf/serviceEvent/performer (this applies to the prescriber and the dispenser).

The template ID referenced here refers to HP information in the /ClinicalDocument/documentationOf/serviceEvent/performer structure. In this document, the same requirements apply to the person author of the document (if there is one), and to the prescriber and dispenser (see body).

When there is no HP but we have the method of assembly of data by a device, such as the “spider” method, we have the following expression; ClinicalDocument/author/assignedAuthor/assignedAuthoringDevice.

When the data is collected from different sources & pre-existing documents that are part of a bigger system. In that case the organization responsible of that collection “signed” the PS as responsible.

ClinicalDocument/author/assignedAuthor/representedOrganization

**Description**

This entry allows for a comment to be supplied with each entry. For CDA this structure is usually included in the target act using the <entryRelationship> element defined in the CDA Schema, but can also be used in the <component> element when the comment appears within an <organizer>. The example below shows recording a comment for an <entry>, and is used as context for the following sections. For HL7 Version 3 Messages, this relationship is represented with the element <sourceOf>, although the remainder of the typecodes and semantics are unchanged.

Any condition or allergy may be the subject of a comment.

| <b>Description</b> |  |                       |   |

The guardians of a patient shall be recorded in the <guardian> element beneath the /clinicalDocument/recordTarget/patientRole/patient XML - <patient> element. Other patient contacts such as the preferred health provider are described using the /clinicalDocument/participant structure. The <associatedEntity> element defines the type of contact. The classCode attribute shall be present, and contains a value from the set AGNT, CAREGIVER, ECON, NOK, or PRS to identify contacts that are agents of the patient, care givers, emergency contacts, next of kin, or other relations respectively.

The relationship between the patient and the guardian or other contact should be recorded in the <code> element. The code attribute is required and comes from the HL7 PersonalRelationshipRoleType vocabulary (epSOSPersonalRelationship value set).

The address of the guardian or other contact should be present, and shall be represented as any other address would be in CDA.

The phone number of the guardian or other contact should be present, and shall be represented as 480 any other phone number would be in CDA.

The name of the guardian or other contact shall be present, and shall be represented as any other name would be in CDA.

**Healthcare Service Identification**

The Healthcare Service Identification information is represented in structures under the /clinicalDocument/author XML element

**Description**  
 /ClinicalDocument/author/assignedAuthor  
 /ClinicalDocument/documentationOf/serviceEvent/performer (this applies to the prescriber and the dispenser).  
 The template ID referenced here refers to HP information in the /ClinicalDocument/documentationOf/serviceEvent/performer structure. In this document, the same requirements apply to the person author of the document (if there is one), and to the prescriber and dispenser (see body).  
 When there is no HP but we have the method of assembly of data by a device, such as the “spider” method, we have the following expression; ClinicalDocument/author/assignedAuthor/assignedAuthoringDevice.  
 When the data is collected from different sources & pre-existing documents that are part of a bigger system. In that case the organization responsible of that collection “signed” the PS as responsible.

**Description**

CDA Documents may reference information contained in other documents. While CDA Release 2.0 supports references in content via the <linkHtml> element, this is insufficient for many EMR systems as the link is assumed to be accessible via a URL, which is often not the case. In order to link an external reference, one needs the document identifier, and access to the clinical system wherein the document resides. For a variety of reasons, it is desirable to refer to the document by its identity, rather than by linking through a URL.

1. The identity of a document does not change, but the URLs used to access it may vary depending upon location, implementation, or other factors.
2. Referencing clinical documents by identity does not impose any implementation specific constraints on the mechanism used to resolve these references, allowing the content to be implementation neutral. For example, in the context of an XDS Affinity domain the clinical system used to access documents would be an XDS Registry and one or more XDS Repositories where documents are stored. In other contexts, access might be through a Clinical Data Repository (CDR), or Document Content Management System (DCMS). Each of these may have different mechanisms to resolve a document identifier to the document resource.
3. The identity of a document is known before the document is published (e.g., in an XDS Repository, Clinical Data Repository, or Document Content Management System), but its URL is often not known. Using the document identity allows references to existing documents to be created before those documents have been published to a URL. This is important to document creators, as it does not impose workflow restrictions on how links are created during the authoring process.

Fortunately, CDA Release 2.0 also provides a mechanism to refer to external documents in an entry, as shown below.

**Description**

A problem observation may reference a health status observation. This structure is included in the target observation using the <entryRelationship> element defined in the CDA Schema. The health status observation records information about the current health status of the patient. The example below shows the recording the health status, and is used as the context for the following sections.

| <b>Status</b>  | 🟢 Active   | <b>Version Label</b>  |   |                |  |
| <b>Name</b>  | eHDSIImmunizationProduct                                 | <b>Display Name</b>   | eHDSI Immunization Product  |                |  |
| <b>Description</b>   |  |                       |   |                |  |
| <p>The product entry describes an immunization used in a &lt;substanceAdministration&gt; act. It adopts the constraints of the ASTM/HL7 Continuity of Care Document.</p> <p>In a CDA document, the name and strength of the immunization administered are specified in the elements under the &lt;manufacturedMaterial&gt; element. The templateId elements are required and identify this as a product entry.</p> <p>The &lt;code&gt; element of the &lt;manufacturedMaterial&gt; describes the vaccine. The values for the code attribute come from the epSOSVaccine value set (OID 1.3.6.1.4.1.12559.11.10.1.3.1.42.28). The code system is SNOMED CT (codeSystem OID 2.16.840.1.113883.6.96).The &lt;originalText&gt; shall contain a &lt;reference&gt; whose URI value points to the generic name and strength of the medication, or just the generic name alone if strength is not relevant.<b>Note:</b> When the text is supplied from the narrative, the implication is that if you supply the components of a combination vaccine in an entry, you must also display these in the narrative text, otherwise you would not be able to break the combination vaccine down into its component parts. This is entirely consistent with the CDA Release 2.0 requirements that the narrative supply the necessary and relevant human readable information content.</p> <p>The &lt;name&gt; element should contain the name of the vaccine (or active ingredient in the case of subordinate &lt;substanceAdministration&gt; elements used to record components of a vaccine). Note that the brand name should be represented as a translation of the code element.</p> |  |                       |   |                |  |

**Description**

The person taking responsibility for the medical content of the document. In Spain this is the regional authority in healthcare. This regional authority healthcare organization will send this to the NCP. The definition of the legal authenticator may vary according to the rules set up in the framework agreement particular to each state. It may be a person or a regional authority, or an NCP.

In any case, as well described in the IG CDA R2 – Imaging Integration: Local policies may choose to delegate the function of legal authentication to a device or system that generates the clinical document. In these cases, the legal authenticator is a person accepting responsibility for the document, not the generating device or system.”

| <b>Description</b> |  |                       |  |

The list of surgeries section shall include entries for procedures and references to procedure reports when known as described in the Entry Content Modules. In epSOS this section should be used to describe the Surgical Procedures prior past six months (optional) and shall be used to record the Major Surgical Procedures past 6 months (required). This choice of considering a time based distinction was due by the subjectivity of 'relevancy' for automatically assembled PS.

As the date can be seen from the procedure, the two have the same expression. It is up to the implementers of the system to display it in a different way.

| <b>Description</b>   |  |                       |   |
| <p>Template CDA ManufacturedProduct (prototype, directly derived from POCD_RM000040 MIF) The medicine entry content module describes a medication used in a &lt;substanceAdministration&gt; or &lt;supply&gt; act. This structure of the HL7 V3 R_Medication Universal Common Message Element (CMET), Release 2.</p> <p>This structure is part of the HL7 V3 2009 Normative Edition (COCT_RM230100UV). The incorporation of this structure is done according to section 1.4 CDA Extensibility of the HL7 CDA standard. Such an extension of a CDA standard is an accepted practice in IHE (e.g. in the XD* Lab specification).</p> <p>For the purposes of WP 3.5 this extension is necessary to satisfy the requirements for eP and eD data elements to represent a generic equivalent and ingredients.</p> <p>The rules of section 1.4 CDA Extensibility require the designation of a new XML namespace for the XML elements in this structure. For the purposes of documentation, the namespace urn:epsos-org:ep:medication is used.</p> <p>The following specification and constraints are applied to the structures of the CMET.</p> <p>The example uses Pyrimon, Chloramphenicol/ Dexamethasone 1% w/v/ 0.1% w/v 5 ml Eye Drops as the medication. The structure is further explained in the following subsections.</p> |  |                       |   |

**Description**

This entry content module makes use of the medicine and instruction entry content modules. Medications and their prescriptions are perhaps the most difficult data elements to model due to variations in the ways that medications are prescribed.

This profile identifies the following relevant fields of a medication as being important to be able to generate in a medical summary. The table below identifies and describes these fields, and indicates the constraints on whether or not they are required to be sent. The fields are listed in the order that they appear in the CDA XML content.

| Field               | CDA Tag                | Description   |
|---------------------|------------------------|---|
| Start and Stop Date | <effectiveTime>        | The date (and time if available) when the medication regimen began and is expected to finish. The first component of the <effectiveTime> encodes the lower and upper bounds over which the <substanceAdministration> occurs, and the start time is determined from the lower bound. If the medication has been known to be stopped, the high value must be present, but expressed as a flavor of null (e.g., Unknown).  |
| Frequency           | <effectiveTime>        | The frequency indicates how often the medication is to be administered. It is often expressed as the number of times per day, but which may also include information such as 1 hour before/after meals, or in the morning, or evening. The second <effectiveTime> element encodes the frequency. In cases where split or tapered doses are used, these may be found in subordinate <substanceAdministration> elements.  |
| Route               | <routeCode>            | The route is a coded value, and indicates how the medication is received by the patient (by mouth, intravenously, topically, et cetera).  |
| Dose                | <doseQuantity>         | The amount of the medication given. This should be in some known and measurable unit, such as grams, milligrams, et cetera. It may be measured in "administration" units (such as tablets or each), for medications where the strength is relevant. In this case, only the unit count is specified, no units are specified. It may be a range.  |
| Product             | <consumable>           |   |
|                     | <manufacturedProduct>  | The name of the substance or product. This should be sufficient for a provider to identify the kind of medication. It may be a trade name or a generic name. This information is required in all medication entries. If the name of the medication is unknown, the type, purpose or other description may be supplied. The name should not include packaging, strength or dosing information. Note: Due to restrictions of the CDA schema, there is no way to explicitly link the name to the narrative text. |
|                     | <manufacturedMaterial> |   |
|                     | <name>                 |   |

| Field                  | CDA Tag  | Description   |
|------------------------|--|---|
|                        | </manufacturedMaterial>  |   |
|                        | </manufacturedProduct>   |   |
|                        | </consumable>  |   |
|                        | <manufacturedMaterial>   |   |
| Strength               | <ingredient><br><quantity> </quantity>                                     | The strength of the medication is expressed as a the ratio of each active ingredient to a unit of medication. For example, the medication Percocet comes in a variety of strengths, which indicate specific amounts of two different medications being received in single tablet. Another example is eye-drops, where the medication is in a solution of a particular strength, and the dose quantity is some number of drops. Note: Due to restrictions of the CDA schema, there is no way to separately record the strength. The epSOS extension is used to provide this information. |
|                        | </ingredient>  | In order to be compliant with the IHE PCC template strength information should be also conveyed through the consumable/code/originalText element as reference to the narrative block.   |
|                        | </manufacturedMaterial>  |   |
|                        | <ingredient>   |   |
|                        | <ingredient>   |   |
| Ingredient Code        | <code/>  | A code describing the active ingredient(s) of the product from a controlled vocabulary, such as ATC, for example.   |
|                        | </ingredient>  |   |
|                        | <ingredient>   |   |
|                        | </manufacturedMaterial>  |   |
| Instructions           | <entryRelationship>  | A place to put free text comments to support additional relevant information, or to deal with specialized dosing instructions. For example, "take with food", or tapered dosing.  |
| Indication             | <entryRelationship>  | A link to supporting clinical information about the reason for providing the medication (e.g., a link to the relevant diagnosis).   |

|------------------------------------|----|------|----------|--|-------------|
| <b>hl7:substanceAdministration</b> |    |      | <b>R</b> | <p>The general model is to record each prescribed medication in a &lt;substanceAdministration&gt; intent (moodCode='INT'). To record medications which were taken in the past, the moodCode shall be set to 'EVN'. The &lt;substanceAdministration&gt; element may contain subordinate &lt;substanceAdministration&gt; elements in a related component entry to deal with special cases (see the following sections below on Special Cases).</p> <p>These cases include split, tapered, or conditional dosing, or combination medications. The use</p> | (eHD...tem) |

| Item | DT | Card | Conf | Description   | Label |
|------|----|------|------|---|-------|
|      |    |      |      | <p>of subordinate &lt;substanceAdministration&gt; elements to deal with these cases is optional. The comment field should always be used in these cases to provide the same information as free text in the top level &lt;substanceAdministration&gt; element. There are a variety of special cases for dosing that need to be accounted for. These are described below. Most of these special cases involve changing the dosage or frequency over time, or based on some measurement. When the dosage changes, then additional entries are required for each differing dosage. The last case deals with combination medications.</p> <p>For the purposes of WP3.5 only the normal, the split dosing and the combination medications are addressed.</p> <ul style="list-style-type: none"> <li>▪ <b>Normal Dosing 1.3.6.1.4.1.19376.1.5.3.1.4.7.1</b></li> </ul> <p>This template identifier is used to identify medication administration events that do not require any special processing. The parent template is 1.3.6.1.4.1.19376.1.5.3.1.4.7. Medications that use this template identifier shall not use subordinate &lt;substanceAdministration&gt; acts.</p> <ul style="list-style-type: none"> <li>▪ <b>Combination Medications 1.3.6.1.4.1.19376.1.5.3.1.4.11</b></li> </ul> <p>This template identifier is used to identify medication administration events that require special processing to handle combination medications. The parent template is 1.3.6.1.4.1.19376.1.5.3.1.4.7. A combination medication is made up of two or more other medications. These may be prepackaged, such as Percocet, which is a combination of Acetaminophen and oxycodone in predefined ratios, or prepared by a pharmacist, such as a GI cocktail.</p> <p>In the case of the prepackaged combination, it is sufficient to supply the name of the combination drug product, and its strength designation in a single &lt;substanceAdministration&gt; entry. The dosing information should then be recorded as simply a count of administration units.</p> <p>In the latter case of a prepared mixture, the description of the mixture should be provided as the product name (e.g., "GI Cocktail"), in the &lt;substanceAdministration&gt; entry. That entry may, but is not required, to have subordinate &lt;substanceAdministration&gt; entries included beneath it to record the components of the mixture.</p> <ul style="list-style-type: none"> <li>▪ <b>Split Dosing 1.3.6.1.4.1.19376.1.5.3.1.4.9</b></li> </ul> |       |

| Item             | DT       | Card    | Conf | Description  | Label       |
|------------------|----------|---------|------|--|-------------|
|                  |          |         |      | <p>This template identifier is used to identify medication administration events that require special processing to handle split dosing. The parent template is 1.3.6.1.4.1.19376.1.5.3.1.4.7. A split dose is often used when different dosages are given at different times (e.g., at different times of day, or on different days). This may be to account for different metabolism rates at different times of day, or to simply address drug packaging deficiencies (e.g., and order for Coumadin 2mg on even days, 2.5mg on odd days is used because Coumadin does not come in a 2.25mg dose form).</p> <p>In this case a subordinate &lt;substanceAdministration&gt; entry is required for each separate dosage.</p> <p>Other template IDs exist for the tapered doses, split dosing, conditional dosing, and combination medications. The reader is pointed to the PCC-TF:2 section 6.1.4.16.5. For the epSOS purposes, only the normal, the combination and the split dosing are described.</p> |             |

### 7.2.44 eHDSI Patient Medication Instructions 1.3.6.1.4.1.19376.1.5.3.1.4.3 - 2020-04-16 13:04:04

|   |  |                       |   |
|---|--|-----------------------|---|
| <b>Id</b>   | 1.3.6.1.4.1.19376.1.5.3.1.4.3  | <b>Effective Date</b> | 2020-04-16 13:04:04<br>Other versions this id:  |
| <b>Status</b>   |  Active | <b>Version Label</b>  | <ul style="list-style-type: none"> <li><input type="radio"/> epsosPatientMedicationInstructions as of 2013-12-20</li> </ul> |
| <b>Name</b>   | eHDSIPatientMedicationInstructions   | <b>Display Name</b>   | eHDSI Patient Medication Instructions   |
| <b>Description</b>  |  |                       |   |
| Any medication may be the subject of further instructions to the patient, for example to indicate that it should be taken with food, etc. |  |                       |   |

This structure is included in the target supply act using the <entryRelationship> element defined in the CDA Schema. The example below shows the recording of patient medication instruction for an <entry>, and is used as context for the following section.

Act classCode

```
<act classCode='ACT' moodCode='INT'>
```

The related statement is the intent (moodCode='INT') on how the related entry is to be performed.

Template Id root

```
<templateId root='2.16.840.1.113883.10.20.1.49' /> <templateId root='1.3.6.1.4.1.19376.1.5.3.1.4.3' />
```

These <templateId> elements identify this <act> as a medication instruction, allowing for validation of the content.

Code

```
<code code='PINSTRUCT' codeSystem='1.3.6.1.4.1.19376.1.5.3.2' codeSystemName='IHEActCode' />
```

The <code> element indicates that this is a patient medication instruction. This element shall be recorded exactly as specified above.

Text-reference

```
<text><reference value='#comment' /></text>
```

The <text> element contains a free text representation of the instruction. This element SHALL contain a <reference> element to the link text of the comment in the narrative portion of the document. The comment itself is not the act being coded, so it appears in the <text> of the <observation>, not as part of the <code>.

Status Code

```
<statusCode code='completed' />
```

The code attribute of <statusCode> for all comments must be completed.

**Description**

This section makes use of the linking, severity, clinical status and comment content specifications defined elsewhere in the technical framework. In HL7 RIM parlance, observations about a problem, complaint, symptom, finding, diagnosis, or functional limitation of a patient is the event (moodCode='EVN') of observing (<observation classCode='OBS'>) that problem. The <value> of the observation comes from a controlled vocabulary representing such things. The <code> contained within the <observation> describes the method of determination from yet another controlled vocabulary. An example appears below in the figure below.

**Parent Template**

This template is compatible with the ASTM/HL7 Continuity of Care Document template: 2.16.840.1.113883.10.20.1.28

```

| Item            | DT | Card | Conf | Description   | Label         |
|-----------------|----|------|------|---|---------------|
| hl7:observation |    |      | R    | The basic pattern for reporting a problem uses the CDA <observation> element, setting the classCode='OBS' to represent that this is an observation of a problem, and the moodCode='EVN', to represent that this is an observation that has in fact taken place. The negationInd attribute, if true, specifies that the problem indicated was observed to not have occurred (which is subtly but importantly different from having not been observed). | (eHD ... lem) |

| Item             | DT  | Card   | Conf | Description   | Label               |
|------------------|-----|--------|------|---|---------------------|
|                  |     |        |      | The value of negationInd should not normally be set to true. Instead, to record that there is "no prior history of chicken pox", one would use a coded value indicated exactly that. However, it is not always possible to record problems in this manner, especially if using a controlled vocabulary that does not supply pre-coordinated negations, or which do not allow the negation to be recorded with post-coordinated coded terminology. |                     |

|----------------------------|------------------------------|---------------|----------|---|----------------------|
| <p>└ hl7:effectiveTime</p> | <p>IVL_TS</p>                | <p>0 .. 1</p> | <p>R</p> | <p>The &lt;effectiveTime&gt; of this &lt;observation&gt; is the time interval over which the &lt;observation&gt; is known to be true. The &lt;low&gt; and &lt;high&gt; values should be no more precise than known, but as precise as possible.</p> <p>While CDA allows for multiple mechanisms to record this time interval (e.g. by low and high values, low and width, high and width, or centre point and width), we are constraining Medical summaries to use only the low/high form.</p> <p>The &lt;low&gt; value is the earliest point for which the condition is known to have existed.</p> <p>The &lt;high&gt; value, when present, indicates the time at which the observation was no longer known to be true. Thus, the implication is made that if the &lt;high&gt; value is specified, that the observation was no longer seen after this time, and it thus represents the date of resolution of the problem.</p> <p>Similarly, the &lt;low&gt; value may seem to represent onset of the problem. Neither of these statements is necessarily precise, as the &lt;low&gt; and &lt;high&gt; values may represent only an approximation of the true onset and resolution (respectively) times. For example, it may be the case that onset occurred prior to the &lt;low&gt; value, but no observation may have been possible before that time to discern whether the condition existed prior to that time.</p> <p>The &lt;low&gt; value should normally be present. There are exceptions, such as for the case where the patient may be able to report that they had chicken pox, but are unsure when. In this case, the &lt;effectiveTime&gt; element shall have a &lt;low&gt; element with a nullFlavor attribute set to 'UNK'. The &lt;high&gt; value need not be present when the observation is about a state of the patient that is unlikely to change (e.g., the diagnosis of an incurable disease).</p> | <p>(eHD ... lem)</p> |
| <p>└ hl7:value</p>         | <p>CD.EPSOS (extensible)</p> | <p>1 .. 1</p> | <p>R</p> | <p>The &lt;value&gt; is the condition that was found. This element is required. While the value may be a coded or an un-coded string, the type is always a coded value (xsi:type='CD'). If coded, the code and codeSystem attributes shall be present.</p> <p>The value set to be used when this template is specialized for describing adverse reaction is eHDSIReactionAllergy.</p>   | <p>(eHD ... lem)</p> |

**Description**

This entry is a specialization of the Concern Entry, wherein the subject of the concern is focused on a problem. Elements shown in the example below in gray are explained in the Concern Entry.

**Parent Template**

The parent of this template is Concern Entry. This template is compatible with the ASTM/HL7 Continuity of Care Document template: 2.16.840.1.113883.10.20.1.27

This entry has a template identifier of 1.3.6.1.4.1.19376.1.5.3.1.4.5.2, and is a subtype of the Concern Entry, and so must also conform to that specification, with the template identifier of 1.3.6.1.4.1.19376.1.5.3.1.4.5.1. These elements are required and shall be recorded exactly as shown.

| <b>Description</b> |  |                       |  |

(CCD) Any problem or allergy observation may reference a problem status observation. This structure is included in the target observation using the <entryRelationship> element defined in the CDA Schema. The clinical status observation records information about the current status of the problem or allergy, for example, whether it is active, in remission, resolved, et cetera. The example below shows the recording of clinical status of a condition or allergy, and is used as the context for the following sections.

This CCD models a problem status observation as a separate observation from the problem, allergy or medication observation. While this model is different from work presently underway by various organizations (i.e., SNOMED, HL7, TermInfo), it is not wholly incompatible with that work. In that work, qualifiers may be used to identify problem status in the coded condition observation, and a separate clinical status observation is no longer necessary. The use of qualifiers in the problem observation is not precluded by this specification or by CCD. However, to support semantic interoperability between EMR systems using different vocabularies, this specification does require that problem status information also be provided in a separate observation. This ensures that all EMR systems have equal access to the information, regardless of the vocabularies they support.

| <b>Name</b>   | eHDSIProcedure   | <b>Display Name</b>   | eHDSI Procedure   |

**Description**

The procedure entry is used to record procedures that have occurred, or which are planned for in the future.

In case no procedures are expected to be recorded, a single “NA” nullFlavored procedure entry shall be included in this section.

| <b>Status</b>   |  Draft | <b>Version Label</b>  |   |
| <b>Name</b>   | eHDSIRelatedDocument  | <b>Display Name</b>   | eHDSI RelatedDocument   |
| <b>Description</b>  |   |                       |   |
| <b>Links among documents</b>  |   |                       |   |
| <p>Depending on the document type, any instance of epSOS pivot CDA shall have a related CDA embedding the PDF representation of the original data from which the epSOS pivot has been derived (also known as “epSOS PDF”). The consumer of the epSOS services shall be able to access this epSOS PDF – if existing - any time it deems it is necessary for the document content comprehension. <i>[epSOS PDF – epSOS pivot link]</i></p> <p>Moreover countries shall be able: for a given epSOS pivot document, to identify the original national data/document (i.e. that in use in their national infrastructure) this CDA comes from <i>[Original document identification]</i>; to trace back from the eD what is the prescription dispensed, and for each dispensed item what is the prescription item supplied. <i>[eD to eP traceability]</i></p> |   |                       |   |

Hereafter how these requirements are fulfilled for the epSOS CDAs.

### Original document identification

The relationship between the eP/eD/PS instance and the document (data) in use in the National Infrastructure (“original Country-A document”) is kept via the XFRM relationship [XFRM (transform) = “The current document is a transformation of the ParentDocument”].

Where the “national” document is identified by its ID as the parentDocument relatedDocument association of the (“aa-bb-cc” in the example "Example of national document identified by its ID").

**N.B.:** This relationship is mandatory for this guide

**NOTE:** Even for countries not dealing with real documents in their National Infrastructures (e.g. data collected from local databases), this mechanism could be useful to identify the collection of data used for generating the epSOS CDAs, facilitating the information backtracking. In that case the ID might be that of the epSOS friendly document or of any other kind of intermediate document used for generating the NCP document input.

### epSOS PDF – epSOS pivot link

The link between the epSOS pivot and the epSOS PDF may be derived at the document level in three ways:

- (1) both have the same relatedDocument (XFRM).parentDocument
- (2) if used, both have the same setId. This value should be equal to the “national document” setId, if existing.
- (3) the pivot have a relatedDocument relationship with the epSOS PDF.

Even if no one of the allowable relationships defined by the CDA standard (XFRM, RPLC, APND) fits perfectly with the relationship existing between the pivot and the PDF CDA; the APND relationship seems to be that better describing the epSOS scenario. In fact “An addendum is a separate document that references the parent document, and may extend or alter the observations in the prior document. The parent document remains a current component of the patient record, and the addendum and its parent are both read by report recipients.”

This relationship would be therefore represented as presented in example "Example of append relationship". Where aa1-bb1-cc1 is in this example the ID of the epSOS PDF.

### eD to eP traceability

Each prescription shall have its own identifier recorded in the element section[templateId/@root='1.3.6.1.4.1.12559.11.10.1.3.1.2.1']/id (see R2.1).

Each prescription item shall have its own identifier recorder in entry/substanceAdministration[templateId/@root='1.3.6.1.4.1.12559.11.10.1.3.1.3.2']/id (see R2.4)

The prescription ID and prescription item ID must be globally unique. In countries where there can be only one item per prescription, the prescription item ID must be the same as the prescription ID

The main mechanism for handling the eD and eP linkage is through the prescription item ID that can be used by the prescribing system or provider to identify the prescription to which it belongs. (see section 12.1.3.4.8 Related prescription item).

Moreover the eD document SHALL refer the prescription ID using the InFulfillmentOf relationship. Please note that the target order.id attribute IS NOT the identifier of the document instance, but that of the prescription (as order).

Description

**Links among documents**

Depending on the document type, any instance of epSOS pivot CDA shall have a related CDA embedding the PDF representation of the original data from which the epSOS pivot has been derived (also known as “epSOS PDF”). The consumer of the epSOS services shall be able to access this epSOS PDF – if existing - any time it deems it is necessary for the document content comprehension. *[epSOS PDF – epSOS pivot link]*

Moreover countries shall be able: for a given epSOS pivot document, to identify the original national data/document (i.e. that in use in their national infrastructure) this CDA comes from *[Original document identification]*; to trace back from the eD what is the prescription dispensed, and for each dispensed item what is the prescription item supplied. *[eD to eP traceability]*

Hereafter how these requirements are fulfilled for the epSOS CDAs.

**Original document identification**

The relationship between the eP/eD/PS instance and the document (data) in use in the National Infrastructure (“original Country-A document”) is kept via the XFRM relationship [XFRM (transform) = “The current document is a transformation of the ParentDocument”].

Where the “national” document is identified by its ID as the parentDocument relatedDocument association of the (“aa-bb-cc” in the example "Example of national document identified by its ID").

**N.B.:** This relationship is mandatory for this guide

**NOTE:** Even for countries not dealing with real documents in their National Infrastructures (e.g. data collected from local databases), this mechanism could be useful to identify the collection of data used for generating the epSOS CDAs, facilitating the information backtracking. In that case the ID might be that of the epSOS friendly document or of any other kind of intermediate document used for generating the NCP document input.

#### epSOS PDF – epSOS pivot link

The link between the epSOS pivot and the epSOS PDF may be derived at the document level in three ways:

- (1) both have the same relatedDocument (XFRM).parentDocument
- (2) if used, both have the same setId. This value should be equal to the “national document” setId, if existing.
- (3) the pivot have a relatedDocument relationship with the epSOS PDF.

Even if no one of the allowable relationships defined by the CDA standard (XFRM, RPLC, APND) fits perfectly with the relationship existing between the pivot and the PDF CDA; the APND relationship seems to be that better describing the epSOS scenario. In fact “An addendum is a separate document that references the parent document, and may extend or alter the observations in the prior document. The parent document remains a current component of the patient record, and the addendum and its parent are both read by report recipients.”

This relationship would be therefore represented as presented in example "Example of append relationship". Where aa1-bb1-cc1 is in this example the ID of the epSOS PDF.

#### eD to eP traceability

Each prescription shall have its own identifier recorded in the element section[templateId/@root='1.3.6.1.4.1.12559.11.10.1.3.1.2.1']/id (see R2.1).

Each prescription item shall have its own identifier recorder in entry/substanceAdministration[templateId/@root='1.3.6.1.4.1.12559.11.10.1.3.1.3.2']/id (see R2.4)

The prescription ID and prescription item ID must be globally unique. In countries where there can be only one item per prescription, the prescription item ID must be the same as the prescription ID

The main mechanism for handling the eD and eP linkage is through the prescription item ID that can be used by the prescribing system or provider to identify the prescription to which it belongs. (see section 12.1.3.4.8 Related prescription item).

Moreover the eD document SHALL refer the prescription ID using the InFulfillmentOf relationship. Please note that the target order.id attribute IS NOT the identifier of the document instance, but that of the prescription (as order).

**Description**

The <templateId> elements identifies this <observation> as a severity observation, allowing for validation of the content. As a side effect, readers of the CDA can quickly locate and identify severity observations. The templateId elements shown above must be present.

| <b>Name</b>        | eHDSISimpleObservation                      | <b>Display Name</b>   | eHDSI Simple Observation  |
| <b>Description</b> |   |                       |   |

The simple observation entry is meant to be an abstract representation of many of the observations used in this specification. It can be made concrete by the specification of a few additional constraints, namely the vocabulary used for codes, and the value representation. A simple observation may also inherit constraints from other specifications (e.g., ASTM/HL7 Continuity of Care Document).

2017-07-18 Reverted to the original IHE specification of this template.

Note that this template was specified by IHE PCC. Find the referenced specification here:

**Description**

The general model is to record each prescribed medication in a <substanceAdministration> intent (moodCode='INT'). The <substanceAdministration> element may contain subordinate <sub-stanceAdministration> elements in a related component entry to deal with special cases (see the following sections below on Special Cases). These cases include split, tapered, or conditional dosing, or combination medications.

The use of subordinate <substanceAdministration> elements to deal with these cases is optional. The comment field should always be used in these cases to provide the same information as free text in the top level <substanceAdministration> element. There are a variety of special cases for dosing that need to be accounted for. These are described below. Most of these special cases involve changing the dosage or frequency over time, or based on some measurement. When the dosage changes, then additional entries are required for each differing dosage. The last case deals with combination medications.

For the purposes of WP3.5 only the normal, the split dosing and the combination medications are addressed.

**- Normal Dosing 1.3.6.1.4.1.19376.1.5.3.1.4.7.1**

This template identifier is used to identify medication administration events that do not require any special processing. The parent template is 1.3.6.1.4.1.19376.1.5.3.1.4.7. Medications that use this template identifier shall not use subordinate <substanceAdministration> acts.

#### - Combination Medications 1.3.6.1.4.1.19376.1.5.3.1.4.11

This template identifier is used to identify medication administration events that require special processing to handle combination medications. The parent template is 1.3.6.1.4.1.19376.1.5.3.1.4.7. A combination medication is made up of two or more other medications. These may be prepackaged, such as Percocet, which is a combination of Acetaminophen and oxycodone in predefined ratios, or prepared by a pharmacist, such as a GI cocktail.

In the case of the prepackaged combination, it is sufficient to supply the name of the combination drug product, and its strength designation in a single <substanceAdministration> entry. The dosing information should then be recorded as simply a count of administration units.

In the latter case of a prepared mixture, the description of the mixture should be provided as the product name (e.g., "GI Cocktail") , in the <substanceAdministration> entry. That entry may, but is not required, to have subordinate <substanceAdministration> entries included beneath it to record the components of the mixture.

#### - Split Dosing 1.3.6.1.4.1.19376.1.5.3.1.4.9

This template identifier is used to identify medication administration events that require special processing to handle split dosing. The parent template is 1.3.6.1.4.1.19376.1.5.3.1.4.7. A split dose is often used when different dosages are given at different times (e.g., at different times of day, or on different days). This may be to account for different metabolism rates at different times of day, or to simply address drug packaging deficiencies (e.g., and order for Coumadin 2mg on even days, 2.5mg on odd days is used because Coumadin does not come in a 2.25mg dose form).

In this case a subordinate <substanceAdministration> entry is required for each separate dosage

| <b>Name</b>   | eHDSISubstanceAdministration   | <b>Display Name</b>   | eHDSI Substance Administration  |

**Description**

The general model is to record each prescribed medication in a <substanceAdministration> intent (moodCode='INT'). The <substanceAdministration> element may contain subordinate <sub-stanceAdministration> elements in a related component entry to deal with special cases (see the following sections below on Special Cases). These cases include split, tapered, or conditional dosing, or combination medications.

The use of subordinate <substanceAdministration> elements to deal with these cases is optional. The comment field should always be used in these cases to provide the same information as free text in the top level <substanceAdministration> element. There are a variety of special cases for dosing that need to be accounted for. These are described below. Most of these special cases involve changing the dosage or frequency over time, or based on some measurement. When the dosage changes, then additional entries are required for each differing dosage. The last case deals with combination medications.

For the purposes of WP3.5 only the normal, the split dosing and the combination medications are addressed.

#### **- Normal Dosing 1.3.6.1.4.1.19376.1.5.3.1.4.7.1**

This template identifier is used to identify medication administration events that do not require any special processing. The parent template is 1.3.6.1.4.1.19376.1.5.3.1.4.7. Medications that use this template identifier shall not use subordinate <substanceAdministration> acts.

#### **- Combination Medications 1.3.6.1.4.1.19376.1.5.3.1.4.11**

This template identifier is used to identify medication administration events that require special processing to handle combination medications. The parent template is 1.3.6.1.4.1.19376.1.5.3.1.4.7. A combination medication is made up of two or more other medications. These may be prepackaged, such as Percocet, which is a combination of Acetaminophen and oxycodone in predefined ratios, or prepared by a pharmacist, such as a GI cocktail.

In the case of the prepackaged combination, it is sufficient to supply the name of the combination drug product, and its strength designation in a single <substanceAdministration> entry. The dosing information should then be recorded as simply a count of administration units.

In the latter case of a prepared mixture, the description of the mixture should be provided as the product name (e.g., "GI Cocktail") , in the <substanceAdministration> entry. That entry may, but is not required, to have subordinate <substanceAdministration> entries included beneath it to record the components of the mixture.

#### **- Split Dosing 1.3.6.1.4.1.19376.1.5.3.1.4.9**

This template identifier is used to identify medication administration events that require special processing to handle split dosing. The parent template is 1.3.6.1.4.1.19376.1.5.3.1.4.7. A split dose is often used when different dosages are given at different times (e.g., at different times of day, or on different days). This may be to account for different metabolism rates at different times of day, or to simply address drug packaging deficiencies (e.g., and order for Coumadin 2mg on even days, 2.5mg on odd days is used because Coumadin does not come in a 2.25mg dose form).

In this case a subordinate <substanceAdministration> entry is required for each separate dosage

| <b>Description</b> |  |                       |  |

The vital signs section contains coded measurement results of a patient’s vital signs.

Warning: Some of these elements were not included in the functional specification of WP3.2, however they have been introduced as optional elements for compliance with IHE PCC. Since they were not validated at a functional level yet, the following elements:

- Vital Signs Observation Interpretation
- Vital Signs Observation method of measurement
- Vital Signs Observation site of measurement

are not activated in current release of epSOS Pivot CDA.

**Description**

A vital signs observation is a simple observation that uses a specific vocabulary, and inherits constraints from CCD.

Note: Although interpretationCode, methodCode and targetSiteCode are foreseen by the parent template, and initially introduced also in the epSOS template, they are not supposed to be actually used in this version since they were not included in the functional specifications and therefore not validated from a functional point of view. Those element have been retained as optional elements, without vocabulary binding defined, only for future consideration.
